e-mail: gintas.misevicius@maf.vu.lt

Keywords: two-dimensional torus, large deviations.

Let Ω_2 be a two-dimensional torus. Let $W = \|a_{ij}\|$, $i, j = 1, 2$, be a square matrix, a_{ij} be integers, $|\det W| = 1$. Let the endomorphism $T: \Omega_2 \rightarrow \Omega_2$ be defined by

$$T\vec{x} = \vec{x}W \pmod{1}.$$

Let

$$\vec{\xi} = \vec{\xi}(t) = \{(\varphi(t), \psi(t)), a \leq t \leq b\} \quad (1)$$

be a smooth parametric curve on Ω_2 , $\Phi(x)$ be a standard normal distribution function. Let $\vec{w}_i = (w_{i1}, w_{i2})$, $i = 1, 2$, be eigenvectors of W corresponding to the eigenvalues θ_1 and θ_2 , $|\theta_1| > 1$, $|\theta_2| = |\theta_1|^{-1}$.

We consider a real function $h(\vec{x})$, $\vec{x} \in \Omega_2$. The problem of large deviations for endomorphisms on torus is formulated in terms of the function h as follows.

Let

$$S_n(\vec{x}) = \sum_{k=0}^{n-1} h(\vec{x}W^k), \quad Z_n(\vec{x}) = \frac{1}{\sigma\sqrt{n}} S_n(\vec{x}),$$

where

$$\sigma^2 = \lim_{n \rightarrow \infty} \int_{\Omega_2} \left(\frac{1}{\sqrt{n}} S_n(\vec{x}) \right)^2 d\vec{x}, \quad \sigma^2 > 0.$$

Then

$$F_{n,\xi}(x) = \frac{1}{b-a} \mu(t \in [a, b]: Z_n(\vec{\xi}) < x) \quad (\mu \text{ is the Lebesgue measure})$$

is a distribution function for which the theorem of large deviations can be proved under some regularity conditions for the function h .

We assume that h satisfies the following conditions:

$$\max \{ |h(\vec{x})|, \vec{x} \in \Omega_2 \} \leq H, \quad (2)$$

$$\int_{\Omega_2} h(\vec{x}) d\vec{x} = 0, \quad (3)$$

$$\int_{\Omega_2} (h(\vec{x}) - h(\vec{x} + \vec{\delta}))^2 d\vec{x} \leq H^2(\delta_1^2 + \delta_2^2), \quad (4)$$

where $\vec{\delta} = (\delta_1, \delta_2)$.

The main result is formulated in the following manner.

THEOREM. *Let the function $h(\vec{x})$, $\vec{x} \in \Omega_2$, and the curve $\vec{\xi}(t)$, $t \in [a, b]$, satisfy the above mentioned conditions. Then, in the interval*

$$0 < x < \frac{c\sqrt{n}}{\ln^2 n}, \quad c > 0,$$

the following relations for the large deviations are valid:

$$\frac{1 - F_{n,\xi}(x)}{1 - \Phi(x)} = \exp \{L(x)\} \left(1 + O\left(\frac{x \ln^2 n}{\sqrt{n}}\right) \right),$$

$$\frac{F_{n,\xi}(-x)}{\Phi(-x)} = \exp \{L(-x)\} \left(1 + O\left(\frac{x \ln^2 n}{\sqrt{n}}\right) \right),$$

where

$$L(x) = \sum_{k=3}^{\infty} \lambda_k x^k,$$

the coefficients λ_k are expressed in terms of cumulants of the sum Z_n .

In [2] the analogous result is proved for the functions h verifying the condition $|h(\vec{x}_1) - h(\vec{x}_2)| \leq H \varrho(\vec{x}_1, \vec{x}_2)$ where $\varrho(\cdot, \cdot)$ is the distance on torus. Therefore the theorem of large deviations is proved now for a wider class of functions h .

The following auxiliary propositions are needed for the proof of Theorem.

LEMMA 1. *Let the functions $f(\vec{x})$ and $g(\vec{x})$, $\vec{x} \in \Omega_2$, satisfy the condition (2) with the constants A and B respectively,*

$$\max_{\vec{x} \in \Omega_2} |f(\vec{x})| \leq A, \quad \max_{\vec{x} \in \Omega_2} |g(\vec{x})| \leq B.$$

Then

$$\int_a^b f(\vec{\xi}) g(\vec{\xi} W^m) dt = \int_a^b f(\vec{\xi}) dt \cdot \int_{\Omega_2} g(\vec{x}) d\vec{x} + O\left(\frac{mAB}{\varepsilon^3 \theta_1^m}\right), \quad (5)$$

$$\int_{\Omega_2} f(\vec{x}) g(\vec{x} W^m) d\vec{x} = \int_{\Omega_2} f(\vec{x}) d\vec{x} \cdot \int_{\Omega_2} g(\vec{x}) d\vec{x} + O\left(\frac{mAB}{\theta_1^m}\right), \quad (6)$$

where $\vec{\xi}(t)$ is a curve defined by (1), θ_1 is an eigenvalue, $|\theta_1| > |\theta_2|$,

$$\varepsilon = \min_{t \in [a, b]} |w_{21}\varphi'(t) - w_{22}\psi'(t)| > 0.$$

Proof. See [1].

Let $\Gamma_k(S_n)$ denote the cumulant of k -th order of the sum $S_n(\vec{x})$.

LEMMA 2. *The cumulants $\Gamma_k(S_n)$ are estimated as follows:*

$$|\Gamma_k(S_n)| \leq H_0 H^k k! (\ln^2 n)^{k-2} n, \quad H_0 > 0.$$

Proof. Denote

$$S_{k,l} = S_{k,l}(\vec{x}) = \sum_{k \leq i \leq l} h(\vec{x} W^i).$$

For some natural numbers n_1 and n_2 , let

$$p = \left\lceil \frac{n}{n_1 + n_2} \right\rceil.$$

The numbers n_1 and n_2 will be chosen later. Denote

$$\eta_k(\vec{x}) = S_{(k-1)(n_1+n_2)+1, kn_2+(k-1)n_1}, \quad 1 \leq k \leq p,$$

$$\eta_k^0(\vec{x}) = S_{kn_2+(k-1)n_1+1, k(n_1+n_2)}, \quad 1 \leq k \leq p,$$

$$\eta_{p+1}^0(\vec{x}) = S_{p(n_1+n_2)+1, n}.$$

We will assume that $\eta_{p+1}^0(\vec{x}) = 0$ if $n = p(n_1 + n_2)$. Then the sum $S_n(\vec{x})$ can be expressed by

$$S_n(\vec{x}) = \sum_{k=1}^p \eta_k(\vec{x}) + \sum_{k=1}^{p+1} \eta_k^0(\vec{x}).$$

Following [2] let us consider the function

$$f_n(t) = \int_{\Omega_2} \prod_{k=1}^p \exp(it\eta_k(\vec{x})) d\vec{x}.$$

As the functions $\eta_k(\vec{x})$ satisfy the conditions of Lemma 1, we get from equation (6):

$$f_n(t) = \left(\int_{\Omega_2} \exp(it\eta_1(\vec{x})) d\vec{x} \right)^p + O(n^2 t H \theta_1^{-n_1}), \quad (7)$$

$$\int_{\Omega_2} h(\vec{x}) h(\vec{x} W^r) d\vec{x} = O(r \theta_1^{-r}), \quad (8)$$

$$\mathbb{E}(\eta_k(\vec{x}) - \mathbb{E}(\eta_k(\vec{x})))^2 = n_2 \sigma^2 + O\left(\frac{1}{(b-a)\epsilon^3}\right). \quad (9)$$

Let a function $g(\alpha_1, \dots, \alpha_\nu)$ have the Taylor expansion on the vicinity of $0 \in \mathbb{R}^\nu$:

$$g(\alpha_1, \dots, \alpha_\nu) = \sum_{k_1, \dots, k_\nu=0}^{\infty} g_{k_1 \dots k_\nu} \cdot \alpha_1^{k_1} \cdots \alpha_\nu^{k_\nu}.$$

The function $g(\alpha_1, \dots, \alpha_\nu)$ is said to be of type M (see [1]) if $g_{k_1 \dots k_\nu} \neq 0$ only if $\max\{k_1, \dots, k_\nu\} \geq 2$.

Functions of type M have the following properties:

- (a) The linear combination and the product of any number of functions of type M is a function of type M .
- (b) If the function $g_1(\alpha_1, \dots, \alpha_\nu)$ is of type M , the function $g_2(\alpha_1, \dots, \alpha_\nu)$ is analytic and

$$\inf_{|(\alpha_1, \dots, \alpha_\nu)| < \varepsilon} g_2(\alpha_1, \dots, \alpha_\nu) > 0 \quad \text{for some } \varepsilon > 0$$

then g_1/g_2 is the function of type M .

The function

$$\varphi_0(\alpha_1, \dots, \alpha_\nu) = \mathbb{E} \exp(\alpha_1 X_{t_1} + \dots + \alpha_\nu X_{t_\nu}), \quad X_n = h(\vec{x} W^n), \quad n \geq 1,$$

has the above mentioned properties. We write down the Taylor expansion for this function, then apply Lemma 1 and (5), and estimate the coefficients of the expansion:

$$\varphi_0(\alpha_1, \dots, \alpha_\nu) = \sum_{k_1, \dots, k_\nu=0}^{\infty} \mathbb{E} X_{t_1}^{k_1} \cdots X_{t_\nu}^{k_\nu} \cdot \alpha_1^{k_1} \cdots \alpha_\nu^{k_\nu}, \quad (10)$$

$$\mathbb{E} X_{t_1}^{k_1} \cdots X_{t_\nu}^{k_\nu} = \mathbb{E} \prod_{i=1}^{q'} h^{k_i}(\vec{x} W^{t_i}) \prod_{i=q'+1}^{\nu} h^{k_i}(\vec{x} W^{t_i}) + \mathcal{O}(d\theta_1^{-d} H^{k_1 + \dots + k_\nu}). \quad (11)$$

Here d depends on the partition of the set $\{t_1, \dots, t_k\}$ into blocks I_1, \dots, I_ν (see [3]).

Using (10) and (11) we can express the function $\varphi_0(\alpha_1, \dots, \alpha_\nu)$ as follows:

$$\varphi_0(\alpha_1, \dots, \alpha_\nu) = \varphi_1(\alpha_1, \dots, \alpha_{q'}) \cdot \varphi_2(\alpha_{q'+1}, \dots, \alpha_\nu) + d\theta_1^{-d} \psi_0(\alpha_1, \dots, \alpha_\nu)$$

where

$$\varphi_1(\alpha_1, \dots, \alpha_{q'}) = \mathbb{E} \exp(\alpha_1 X_{t_1} + \dots + \alpha_{q'} X_{t_{q'}}),$$

$$\varphi_2(\alpha_{q'+1}, \dots, \alpha_\nu) = \mathbb{E} \exp(\alpha_{q'+1} X_{t_{q'+1}} + \dots + \alpha_\nu X_{t_\nu})$$

and the function $\psi_0(\alpha_1, \dots, \alpha_\nu)$ is analytic, $\psi_0(0, \dots, 0) = 0$.

For the evaluation of cumulants $\Gamma_k(S_n)$ we chose n_1 from the relation $0 \leq n - p(n_1 + n_2) \leq p$, $n_2 = [\omega_2 \ln n]$ and make use of the properties of functions of type M for evaluation of functions $f_n(t)$. These are only the main points of the proof of Lemma 2.

The proof of Theorem follows from Lemma 1, Lemma 2 and is analogous to Theorem 3 in [4].

B. Kryžienė, G. Misevičius. Toro endomorfizmų didieji nuokrypiai, II

Darbe suformuluota ir įrodyta teorema apie didžiuosius nuokrypius dydžiams $h(\bar{x}W^k)$, $k = 0, 1, 2, \dots$, kur W yra toro Ω_2 endomorfizmas. Lyginant su ankstesniu autorių darbu teorema įrodoma platesnei funkcijų h klasei. Įrodymui naudojami D. Moskvino ir autorių ankstesni rezultatai bei V. Statulevičiaus centruotų momentų ir semiinvariantų įverčiai.
