

Large deviations for endomorphisms of torus

Birutė KRYŽIENĖ (VGTU), Gintautas MISEVIČIUS (VU)

e-mail: gintas.misevicius@maf.vu.lt

Keywords: two-dimensional torus; large deviations; cumulant.

Let Ω_2 be a two-dimensional torus, $\vec{x}, \vec{x}_1, \vec{x}_2, \dots \in \Omega_2$. The distance for elements of torus is defined by

$$\begin{aligned} \rho(\vec{x}_1, \vec{x}_2) &= \rho(C_{\vec{x}_1}, C_{\vec{x}_2}) \\ &= \inf \left\{ \rho((x_{11}, x_{12}), (x_{21}, x_{22})) : (x_{11}, x_{12}) \in C_{\vec{x}_1}, (x_{21}, x_{22}) \in C_{\vec{x}_2} \right\}, \end{aligned}$$

where $C_{\vec{x}_1}$ and $C_{\vec{x}_2}$ are equivalence classes in \mathbb{R}^2 modulo \mathbb{Z}^2 .

Let $W = \|a_{ij}\|$ be a square matrix of integer elements. Let the endomorphism $T: \Omega_2 \rightarrow \Omega_2$ be defined by

$$T\vec{x} = \vec{x} W \pmod{1}.$$

If the eigenvalues of the matrix W are not equal to 1, then the mapping T is invariant with respect to Lebesgue measure μ_2 on \mathbb{R}^2 .

If $\det W \neq \pm 1$, then the mapping T is an automorphism.

These and other properties of mappings of torus can be found in [1,2]. This article is a continuation of investigation by D. Moskvin [2] and of earlier papers by authors [3,4].

Let

$$\vec{\xi} = \vec{\xi}(t) = \{(\varphi(t), \psi(t)), a \leq t \leq b\} \quad (1)$$

be a smooth parametric curve on Ω_2 , $\Phi(x)$ be a standard normal distribution function. Let $\vec{w}_i = (w_{i1}, w_{i2})$, $i = 1, 2$, be eigenvectors of W corresponding to the eigenvalues θ_1 and θ_2 , $|\theta_1| > 1$, $|\theta_2| = |\theta_1|^{-1}$.

Let $h(\vec{x})$, $\vec{x} \in \Omega_2$, be a real function of two arguments satisfying the condition

$$|h(\vec{x}_1) - h(\vec{x}_2)| \leq H\rho(\vec{x}_1, \vec{x}_2), \quad (2)$$

where $H \geq \{\max |h(\vec{x})|, \vec{x} \in \Omega_2\}$,

$$\int_{\Omega_2} h(\vec{x}) d\vec{x} = 0. \quad (3)$$

Let us consider

$$S_n(\vec{x}) = \sum_{k=0}^{n-1} h(\vec{x} W^k), \quad Z_n(\vec{x}) = \frac{1}{\sigma\sqrt{n}} S_n(\vec{x}),$$

where

$$\sigma^2 = \lim_{n \rightarrow \infty} \int_{\Omega_2} \left(\frac{1}{\sqrt{n}} S_n(\vec{x}) \right)^2 d\vec{x}, \quad \sigma^2 > 0.$$

Two distribution functions can be defined:

$$F_n(x) = \mu_2(\vec{x} \in \Omega_2: Z_n(\vec{x}) < x),$$

$$F_{n,\xi}(x) = \frac{1}{b-a} \mu_1(t \in [a, b]: Z_n(\vec{\xi}) < x).$$

The main result of this article is

THEOREM 1. *Let the function $h(\vec{x})$, $\vec{x} \in \Omega_2$, and the curve $\vec{\xi}(t)$, $t \in [a, b]$, satisfy the above mentioned conditions. Then in the interval*

$$0 \leq x \leq \frac{c\sqrt{n}}{\ln^2 n}, \quad c > 0,$$

the following relations for the large deviations are valid:

$$\frac{1 - F_n(x)}{1 - \Phi(x)} = \exp\{L(x)\} \left(1 + O\left(\frac{x \ln^2 n}{\sqrt{n}}\right) \right),$$

$$\frac{F_n(-x)}{\Phi(-x)} = \exp\{L(-x)\} \left(1 + O\left(\frac{x \ln^2 n}{\sqrt{n}}\right) \right),$$

where

$$L(x) = \sum_{k=3}^{\infty} \lambda_k x^k,$$

the coefficients λ_k are expressed in terms of cumulants of the sum Z_n , and coincide with the coefficients of the classical Cramér–Petrov series.

The analogous results are valid for the distribution function $F_{n,\xi}(x)$.

The following auxiliary propositions are needed for the proof of Theorem 1.

LEMMA 1. *Let the functions $f(\vec{x})$ and $g(\vec{x})$, $\vec{x} \in \Omega_2$, satisfy the condition (2) with the constants A and B respectively,*

$$\max_{\vec{x} \in \Omega_2} |f(\vec{x})| \leq A, \quad \max_{\vec{x} \in \Omega_2} |g(\vec{x})| \leq B.$$

Then

$$\int_a^b f(\vec{\xi}) g(\vec{\xi} W^m) dt = \int_a^b f(\vec{\xi}) dt \cdot \int_{\Omega_2} g(\vec{x}) d\vec{x} + O\left(\frac{mAB}{\varepsilon^3 \theta_1^m}\right), \quad (4)$$

$$\int_{\Omega_2} f(\vec{x}) g(\vec{x} W^m) d\vec{x} = \int_{\Omega_2} f(\vec{x}) d\vec{x} \cdot \int_{\Omega_2} g(\vec{x}) d\vec{x} + O\left(\frac{mAB}{\theta_1^m}\right), \quad (5)$$

where $\vec{\xi}(t)$ is a curve defined by (1), θ_1 is an eigenvalue, $\theta_1 > \theta_2$,

$$\varepsilon = \min_{t \in [a, b]} |w_{21} \varphi'(t) - w_{22} \psi'(t)| > 0.$$

Proof. See [2].

Denote

$$S_{k,l} = S_{k,l}(\vec{x}) = \sum_{k \leq i \leq l} h(\vec{x} W^i).$$

Let q and m be natural numbers which will be chosen later, $p = [\frac{n}{q} + m]^{-1}$.

Denote

$$\begin{aligned} \eta_k(\vec{x}) &= S_{(k-1)(q+m)+1, kq+(k-1)m}, \quad 1 \leq k \leq p, \\ \eta_k^0(\vec{x}) &= S_{kq+(k-1)m+1, k(q+m)}, \quad 1 \leq k \leq p, \\ \eta_{p+1}^0(\vec{x}) &= S_{p(q+m)+1, n}. \end{aligned}$$

Then the sum $S_n(\vec{x})$ can be expressed as follows:

$$S_n(\vec{x}) = \sum_{k=1}^p \eta_k(\vec{x}) + \sum_{k=1}^{p+1} \eta_k^0(\vec{x}) = \zeta_n(\vec{x}) + \zeta_n^0(\vec{x}).$$

LEMMA 2. *The characteristic function*

$$f_n(t) = \int_{\Omega_2} \exp(it \zeta_n(\vec{x})) d\vec{x}$$

can be evaluated as follows:

$$f_n(t) = \left(\int_{\Omega_2} \exp(it \eta_1(\vec{x})) d\vec{x} \right)^p + O\left(\frac{n^2 t H}{\theta_1^m}\right).$$

Proof. See [2].

LEMMA 3. *The following estimate is valid:*

$$\mathbf{D}S_n(\vec{x}) = \sigma^2 n + O(1). \quad (6)$$

Proof. By making use of (3) and regrouping summands we get:

$$\begin{aligned} \mathbf{D}S_n(\vec{x}) &= \mathbf{E}S_n^2(\vec{x}) \\ &= n \int_{\Omega_2} h^2(\vec{x}) \, d\vec{x} + 2n \sum_{j=1}^{n-1} \left(1 - \frac{j}{n}\right) \int_{\Omega_2} h(\vec{x})h(\vec{x} W^j) \, d\vec{x} \\ &= n \left(\int_{\Omega_2} h^2(\vec{x}) \, d\vec{x} + 2 \sum_{j=1}^{\infty} \int_{\Omega_2} h(\vec{x})h(\vec{x} W^j) \, d\vec{x} \right) \\ &\quad - 2n \sum_{j=n}^{\infty} \int_{\Omega_2} h(\vec{x})h(\vec{x} W^j) \, d\vec{x} - 2 \sum_{j=1}^{n-1} j \int_{\Omega_2} h(\vec{x})h(\vec{x} W^j) \, d\vec{x}. \end{aligned}$$

Having in mind the definition of σ^2 and taking $f(\vec{x}) = g(\vec{x}) = h(\vec{x})$ in (5) (Lemma 1) we get the estimate (6).

Let $\Gamma_k(S_n)$ denote the cumulant of k -th order of the sum $S_n(\vec{x})$. The estimate $\Gamma_k(S_n) = O(n)$ is known [2]. We will show now the dependence of this estimate on the properties of $h(\vec{x})$ and on the order of the cumulant.

LEMMA 4. *The following estimate is valid:*

$$\Gamma_k(S_n) \leq H_0 H^k k! (\ln^2 n)^{k-2} n, \quad H_0 > 0.$$

Proof. Let $\hat{\mathbf{E}}X_{t_1} \dots X_{t_k}$ be the centered moment of the k -th order. The estimates of such moments are very important in limit theorems for sums of dependent random variables. Analogous to Theorem 4.4 in [5], based on (4) and Lemma 2, we can prove that

$$|\hat{\mathbf{E}}\xi_{t_1} \dots \xi_{t_k}| \leq 2^{k-1} H^k \prod_{j=1}^{r-1} \frac{l_{j+1} - l_j}{\theta_1^{l_{j+1} - l_j}}. \tag{7}$$

Making use of the definition of cumulants, Lemma 1.1 in [5], and the expression of cumulants in terms of centered moments we get:

$$\begin{aligned} \Gamma_k(S_n) &= \sum_{1 \leq t_1, \dots, t_k \leq n} \Gamma(X_{t_1}, \dots, X_{t_k}), \\ \Gamma(X_{t_1}, \dots, X_{t_k}) &= \sum_{\nu=1}^k (-1)^{\nu-1} \sum_{\cup_{p=1}^{\nu} I_p = I} N_{\nu}(I_1, \dots, I_{\nu}) \prod_{p=1}^{\nu} \hat{\mathbf{E}}(X_{I_p}). \end{aligned}$$

Here the integers $N_{\nu}(I_1, \dots, I_{\nu})$,

$$0 \leq N_{\nu}(I_1, \dots, I_{\nu}) \leq (\nu - 1)!,$$

depend on ν -block partition $\{I_1, \dots, I_\nu\}$ of the set $I = \{t_1, \dots, t_k\}$ only, and

$$\hat{\mathbf{E}}(X_{I_p}) = \hat{\mathbf{E}}(X_{i_1} \dots X_{i_p}).$$

Analogous to Theorem 4.11 in [5] we get from the inequality (7):

$$|\Gamma(\xi_{t_1}, \dots, \xi_{t_k})| \leq (k-1)! \cdot 2^{k-1} H^k \prod_{j=1}^{r-1} \frac{l_{j+1} - l_j}{\theta_1^{l_{j+1} - l_j}}.$$

Now we take $q = [\omega_1 \ln n]$, $m = [\omega_2 \ln n]$ ($\omega_1 > 0$, $\omega_2 > 0$). Making use of the above listed estimates, in a way analogous to Theorem 4.1.9 in [5], we get the proposition of Lemma 4.

From the estimates of cumulants of the sum $S_n(\vec{x})$ we get the estimates of cumulants of the normed sum $Z_n(\vec{x})$:

$$\Gamma_k(Z_n) \leq H_0^* H^k k! \left(\frac{\ln n}{\sqrt{n}} \right)^{k-2}.$$

Making use of Lemmas 1–4 and Lemma 2.3 in [5] we obtain the proof of our main Theorem 1.
