

Asymptotic expansion in the zones of large deviations in terms of Lyapunov's fractions

L. Saulis (VGTU, MII)

Let $\xi_1, \xi_2, \dots, \xi_n$, $n \geq 1$, be an independent random variable (r.v.) with $\mathbf{E}\xi_j = 0$ and $\sigma_j^2 = \mathbf{E}\xi_j^2 > 0$, $j = 1, 2, \dots, n$.

Set

$$S_n = \sum_{j=1}^n \xi_j, \quad B_n^2 = \sum_{j=1}^n \sigma_j^2, \quad Z_n = \frac{S_n}{B_n},$$

$$F_{Z_n}(x) = \mathbf{P}(Z_n < x), \quad p_{Z_n}(x) = \frac{d}{dx} F_{Z_n}(x), \quad (1)$$

$$L_{k,n} = \sum_{j=1}^n \mathbf{E}|\xi_j|^k / B_n^k, \quad k = 1, 2, \dots \quad (2)$$

The quantity $L_{k,n}$ is called the k^{th} Lyapunov fraction and for $2 \leq k \leq l$,

$$L_{k,n}^{1/(k-2)} \leq L_{l,n}^{1/(l-2)} \quad (3)$$

what is proved in (Saulis, Statulevičius (1989), (1991)).

As it is known, Lyapunov's fractions are convenient for constructing asymptotical expansions (Statulevičius (1965)) for distribution function $F_{Z_n}(x)$ and distribution density function $p_{Z_n}(x)$ of the r.v. Z_n .

It turns out that probabilities of large deviations $\mathbf{P}(Z_n \geq x)$, $x = x(n) \rightarrow \infty$, $n \rightarrow \infty$, in the Cramer zone and Linnik power zones can also be investigated in terms of Lyapunov fractions. Thus, probabilities of large deviations in such zones mainly depend not on individual but average properties of summands as emphasized in (Wolf (1975), Rudzkiš, Saulis, Statulevičius (1979), (1991)).

The paper is devoted for investigating asymptotic expansions of probability $\mathbf{P}(Z_n \geq x)$ as in zones of Cramer as well in Linnik power zones in terms of Lyapunov's fractions.

The cumulant of r.v. Z_n be denoted by $\Gamma_k(Z_n)$ and defined by the formula

$$\Gamma_k(Z_n) := \frac{1}{i^k} \frac{d^k}{dt^k} \ln f_{Z_n}(t) \Big|_{t=0}, \quad (4)$$

where

$$f_{Z_n}(t) := \mathbf{E}e^{itZ_n} = \prod_{j=1}^n f_{\xi_j}(t/B_n) \quad (5)$$

a be characteristic function (c.f) of the r.v. Z_n .

We say that Lyapunov's fractions $L_{k,n}$ satisfy (L^*) condition if exist $\gamma \geq 0$ and $\tau_n > 0$ such that

$$L_{k,n} \leq \frac{(k!)^{1+\gamma}}{\tau_n^{k-2}}, \quad k = 3, 4, \dots \tag{L^*}$$

PROPOSITION 1. *If the r.v. γ_j with $\mathbf{E}\xi_j = 0$ and $\sigma_j^2 = \mathbf{E}\xi_j^2 > 0$, $j = 1, 2, \dots, n$, satisfy condition (L^*) with the exponent $\gamma = 0$, then*

$$|\Gamma_k(Z_n)| \leq \frac{k!}{(\tau_n/(27|\ln \tau_n|))^{k-2}}, \quad k = 3, 4, \dots \tag{6}$$

If condition (L^) with the exponent $\gamma > 0$ is fulfilled, then*

$$|\Gamma_k(Z_n)| \leq \frac{(k!)^{1+\gamma}}{(\tau_n/C_1(\gamma))^{k-2}} \vee \frac{k!}{\tau_n^2(\tau_n^{1/(1+2\gamma)}/C_2(\gamma))^{k-2}}, \quad k = 3, 4, \dots, \tag{7}$$

where $a \vee b = \max\{a, b\}$.

Full and complicated proof of this statement is in (Rudzkis, Saulis, Statulevičius (1979)), where explicit expressions quantities $C_1(\gamma)$ and $C_2(\gamma)$ are presented.

Suppose that for a r.v. ξ_j with $\mathbf{E}\xi_j = 0$ and $\sigma_j^2 = \mathbf{E}\xi_j^2 < \infty$, $j = \overline{1, n}$, there exist densities $p_{\xi_j}(x)$ such that

$$\sup_x p_{\xi_j}(x) \leq C_j \leq \infty. \tag{D}$$

In the case ξ_j has density, then $C_j = \infty$ by definition.

Let $\xi_j(h)$, $j = 1, 2, \dots, n$, be the r.v. with the distribution density

$$p_{\xi_j}(x) := e^{hx} p_{\xi_j}(x) / \int_{-\infty}^{\infty} e^{hx} p_{\xi_j}(x) dx \tag{8}$$

and the characteristic function

$$f_{\xi_j(h)}(t) = \mathbf{E} \exp \{it\xi_j(h)\}.$$

Put

$$S_n(h) = \sum_{j=1}^n \xi_j(h), \quad Z_n(h) = \frac{S_n(h) - M_n(h)}{B_n(h)}, \tag{9}$$

where

$$M_n(h) = \mathbf{E}S_n(h) = \sum_{k=2}^{\infty} \frac{1}{(k-1)!} \Gamma_k(S_n) h^{k-1}, \tag{10}$$

$$B_n^2(h) = \mathbf{D}S_n(h) = \sum_{k=2}^{\infty} \frac{1}{(k-2)!} \Gamma_k(S_n) h^{k-2}, \tag{11}$$

and

$$f_{Z_n(h)}(t) := \mathbf{E} e^{itZ_n(h)} = \prod_{j=1}^n f_{\xi_j(h)}(t/B_n(h)). \tag{12}$$

Here $f_{Z_n(h)}(t)$ is the characteristic function of r.v. $Z_n(h)$ conjugate with r.v. Z_n .

The author of this paper has proved that

$$\Gamma_k(S_n(h)) = \sum_{l=k}^{\infty} \frac{1}{(l-k)!} \Gamma_l(S_n) h^{l-k}, \quad k = 2, 3, \dots \tag{13}$$

Let

$$\tau_n^* = \begin{cases} \frac{c\tau_n}{|\ln \tau_n|}, & \gamma = 0, \\ c_\gamma^* \tau_n^{1/(1+2\gamma)}, & \gamma > 0, \end{cases} \tag{14}$$

where explicit expressions quantities c and c_γ^* are presented in (Rudzkiš, Saulis, Statulevičius (1979)), and

$$f_{n,\gamma}^*(t) = \begin{cases} \sum_{k=0}^s \left(\frac{3}{2}\right)^k \frac{x^k}{k!} f_{Z_n}^{(k)}(t), & \gamma > 0, \\ f_{Z_n(h)}(t), & \gamma = 0. \end{cases} \tag{15}$$

Here $\sqrt{s} \geq c_\gamma^* \tau_n^{1/(1+2\gamma)}$ and $f_{Z_n}(t)$, $f_{Z_n(h)}(t)$ are defined by relation (5) and (13).

The estimates (6) and (7) of cumulants of r.v. Z_n and the authors lemma (Saulis (1996)) of asymptotic of distribution function in zones of large deviations for a r.v. with cumulants of regular behaviour enable to obtain the following statement.

Let Θ (with or without an index) denote some variable, not always the same, not exceeding 1 in absolute value.

PROPOSITION 2. *If the r.v. ξ_j with $\mathbf{E}\xi_j = 0$ and $\sigma_j^2 = \mathbf{E}\xi_j^2 > 0$, $j = 1, 2, \dots, n$, satisfy condition (L^*) , then $\forall l, l \geq 3$, in the interval*

$$0 \leq x < \tau_n^* \tag{16}$$

the relation of large deviation

$$\frac{1 - F_{Z_n}(x)}{1 - \Phi(x)} = \exp \{L_{n,m}^*(x)\} \left\{ \frac{\psi(x)}{\psi(u_n)} \left(1 + \sum_{\nu=1}^{l-3} L_{n,\nu}(u_n) \right. \right. \tag{17}$$

$$\left. \left. + \theta_1(x+1) \left[\frac{c(l, \gamma, x)}{(\tau_n/|\ln \tau_n|)^{l-2}} + \frac{285\tau_n^* \exp \{-(1-x/\tau_n^*)\sqrt{\tau_n^*}\}}{(1-x/\tau_n^*)} + \frac{6q}{T_n} + R_{n,\gamma} \right] \right\}$$

holds.

Here the quantities $c(l, \gamma, x)$ and q are defined by relations (9) and (58) (Saulis (1996));

$$\psi(x) = \frac{\varphi(x)}{1 - \Phi(x)}, \tag{18}$$

where $\varphi(x)$ and $\Phi(x)$ are standard normal density and distribution function;

$$L_{n,m}^*(x) = \sum_{3 \leq k < m} \lambda_{k,n} x^k, \quad m = \begin{cases} (1/\gamma) + l - 1, & \gamma > 0, \\ \infty, & \gamma = 0, \end{cases} \tag{19}$$

where the coefficients $\lambda_{k,n}$ are expressed in terms of cumulants of the r.v. Z_n and are found from the recurrent equations (2.9) (Saulis, Statulevičius (1989), (1991)):

$$\begin{aligned} \lambda_{3,n} &= \frac{1}{3} \Gamma_3(Z_n), \\ \lambda_{4,n} &= \frac{1}{24} (\Gamma_4(Z_n) - 3\Gamma_3^2(Z_n)), \dots \end{aligned}$$

Formulas for $L_{n,\gamma}(u_n)$ are presented in (Saulis (1996)):

$$\begin{aligned} L_{n,1}(u_n) &= -\frac{1}{3} \Gamma_3(Z_n) \frac{1}{x} + \frac{3}{2} (2\Gamma_4(Z_n) - 3\Gamma_3^2(Z_n)) \\ &+ \frac{1}{48} (72\Gamma_5(Z_n) - 39\Gamma_3(Z_n)\Gamma_4(Z_n) + 267\Gamma_3^3(Z_n))x + \dots; \end{aligned}$$

$$R_{n,\gamma} = \int_{T_{n,\gamma}}^{T_n} \left| f_{n,\gamma}^*(t) \right| \frac{dt}{t}, \tag{20}$$

where $f_{n,\gamma}^*(t)$ is defined by (15) and

$$T_{n,\gamma} = (3/8)(1 - x/\tau_n^*)\tau_n^*, \quad T_n \geq T_{n,\gamma}. \tag{21}$$

So, in order to obtain asymptotic expansions in Cramer zone and Linnik power zones of large deviation probabilities $\mathbf{P}(Z_n \geq x) = 1 - F_{Z_n}(x)$ we need to estimate the integral $R_{n,\gamma}$ defined in (20) for $\gamma = 0$ and $\gamma > 0$.

PROPOSITION 3. *If for a r.v. ξ_j with $\mathbf{E}\xi_j = 0$ and $\sigma_j^2 = \mathbf{E}\xi_j^2 > 0, j = 1, 2, \dots, n$, conditions (L^*) with the exponent $\gamma = 0$ and (D) are fulfilled, then*

$$R_{n,\gamma} \leq B_1 K_n^2 \max_{1 \leq r_i \leq n} \prod_{i=1}^4 C_{r_i}^{1/4} \exp \left\{ -\frac{1}{K_n^2} \sum_{j=1}^n \frac{1}{C_j^2} \right\}, \tag{22}$$

where

$$K_n = B_n |\ln \tau_n| / \tau_n. \tag{23}$$

PROPOSITION 4. If r.v. ξ_j satisfies conditions (L^*) with $\gamma > 0$, (D) and

$$\lim_{n \rightarrow \infty} \frac{1}{(1 \vee L_{1,n})\tau_n^*} \sum_{k=1}^n \frac{1}{(\sigma_k^2 + N_n^2)C_k^2} \geq c_1 > 0,$$

$$N_n = 4B_n L_{3,n}, \quad \tau_n^* = c_\gamma^* \tau_n^{1/(1+2\gamma)},$$

then

$$\begin{aligned} R_{n,\gamma} \leq & B_2(N_n/T_{n,\gamma}) \max_{1 \leq r_i \leq n} \prod_{i=1}^4 C_{r_i}^{1/4} \left(1 + \frac{\pi \sigma_{r_i}}{2\sqrt{2}N_n}\right) \\ & \times \exp \left\{ -\frac{1}{4} \sum_{k=1}^n \frac{1}{(\sigma_k^2 + N_n^2)C_k^2} \right\}, \end{aligned} \quad (24)$$

where $T_{n,\gamma} = (3/8)(1 - x/\tau_n^*)\tau_n^*$.
